

CORPORATE STRATEGY

Session 9: Data Use Case implementation

Antoine MADELIN

TABLE OF CONTENT

1. RECAP ON SESSION 8& OBJECTIVES OF THE DAY
2. DATA STRATEGY
3. CASE STUDY & GROUP EXERCISE

Introduction

Think of an app or platform you used this week-end.

1

DATA

What data does it collect about you?

Behavior, location, content, timing, social graph...

2

DECISION / VALUE

What do you think they do with it?

Which decision does it enable? Who benefits internally?

Introduction – Strava Example

The Strava logo is displayed in a bold, orange, sans-serif font.

Data Partnerships

Better communities for cyclists and pedestrians

The Strava dataset is the leading platform for active transportation data. Metro aggregates, de-identifies and contextualizes this dataset to help make communities, streets and trails better for anyone on foot or on a bike.

We work with urban and trail planners, outdoor recreation teams, city governments and safe-infrastructure advocates to understand mobility patterns, identify opportunities for investment and evaluate the impact of infrastructure changes – access to Strava Metro is free of charge.

[Apply for a Metro Partnership](#)

What is a Data Use Case?

A data use case is a specific, bounded application of data to solve a business problem or capture a business opportunity.

A well-defined use case answers 4 questions

01 What data is used?

02 What method is applied?

03 What decision is enabled?

04 What is the business impact?

Good use case vs. vague statement

GOOD

Use historical transaction data + customer demographics to predict churn probability at 30 days and trigger a retention offer

TOO VAGUE

Use data to understand customers better

The Data Value Chain

To generate value, a use case must traverse the full data value chain. Analysis without action delivers no business value.

A use case that stops at step 4 (Analysis) without reaching step 5 (Decision/Action) delivers zero business value. The most common failure mode is producing dashboards that nobody acts upon.

How to Prioritize Data Use Cases (1/2)

BUSINESS VALUE	LOW VALUE HIGH FEASIBILITY	HIGH VALUE HIGH FEASIBILITY
	LOW VALUE LOW FEASIBILITY	HIGH VALUE LOW FEASIBILITY
	Low priority Automate & deprioritize	Quick wins Start now
	Drop	Strategic bets Invest & sequence
	FEASIBILITY	

Score the following topic (high, medium, low) in the good category (Feasability or business value)

- Indirect or long-cycle
- Some gaps or modeling effort
- Direct P&L, measurable <6M
- Data exists, clear owner
- Compliance only
- New infra or deep ML required

How to Prioritize Data Use Cases (2/2)

For each scenario: (1) Score business value High / Medium / Low (2) Score feasibility High / Medium / Low

SCENARIO A

Churn prediction model

B2B SaaS, 800 customers. You want to predict which accounts will not renew in the next 60 days, using product usage + NPS data. No labeled historical churn dataset exists yet.

SCENARIO B

Account health scoring

Same company. CRM data and product usage already exist. You build a Red/Amber/Green scoring dashboard for the CS team to prioritize their weekly calls. Rule-based, no ML needed.

SCENARIO C

Real-time pricing engine

Marketplace. Dynamically adjust listing prices every 5 minutes based on competitor data, demand signals, and inventory. Requires real-time data pipeline and ML model not yet in production.

Data Use Cases in B2B vs. B2C

	B2B	B2C
Volume of data	Lower (fewer accounts)	Higher (large user base)
Data richness per account	High - contract data, usage logs (SaaS), adoption rate	Medium - transactions, web behavior
Key use cases	Account health scoring, expansion revenue prediction, NPS by segment	Churn prevention, personalization, basket optimization, NPS
Analytics maturity required	Medium - SQL + CRM dashboards often sufficient	High - ML, real-time pipelines
Decision speed	Slow - aligns with sales cycle	Fast - automated triggers in real time

Key KPIs to Measure a Data Use Case

	Definition	Why it matters
Model precision / recall	Accuracy of the predictive model on test data	Validates technical quality before deployment
Decision adoption rate	% of model outputs acted upon by users or systems	Measures operational embedding - a model unused = zero value
Time to value	Delay between data availability and triggered action	Measures pipeline efficiency and real-time capability
Incremental revenue / savings	P&L impact attributable to the use case (A/B test)	Business ROI - the only KPI that ultimately matters
Data freshness	Lag between real-world event and data availability	Constrains real-time use cases (fraud, pricing)
Coverage rate	% of eligible population reached by the use case	Scales impact - a 90% coverage doubles a 45% coverage

Common Pitfalls

Dashboards no one uses

Analysis without a decision owner is waste. Always assign a business owner before building.

Starting with data, not the problem

Always start from the business question. Data is a means, not the objective.

Underestimating data quality

Garbage in, garbage out. 80% of effort is data prep, not modeling.

Ignoring change management

A model unused by the team creates zero value. Adoption = transformation project.

Model sophistication over relevance

A simple rule-based model used daily beats a complex ML model that is ignored.

Treating it as an IT project

Data use cases are business transformation projects. They require business ownership, not just engineering.

Data use cases examples (1/2)

	Use Case	Verified Impact
Netflix	Personalized Recommendation Engine	80% of watch time from algo; \$1B+/yr churn reduction; 93% original content success rate
UPS - ORION	Prescriptive Route Optimization	100M miles/yr saved; \$300-400M/yr savings vs. \$250M build cost; 100k tons CO2 avoided
JPMorgan - COiN	NLP Contract Intelligence	360,000 lawyer-hours/yr saved; review time: days to seconds; compliance errors down ~80%

Data use cases examples (2/2)

	Use Case	Verified Impact
Amazon	Recommendation + Demand Forecasting	35% of e-commerce revenue from recommendations; excess inventory reduced 30%+
American Express	Real-Time Fraud Detection	Fraud loss rate <0.1% of spend; real-time flagging pre-settlement
Toyota	Predictive Maintenance (assembly lines)	Unplanned downtime significantly reduced; applied globally

TABLE OF CONTENT

1. RECAP ON SESSION 8& OBJECTIVES OF THE DAY
2. DATA STRATEGY
3. CASE STUDY & GROUP EXERCISE

Case study

Company Profile

- French B2B SaaS - workforce management software
- Target: mid-market companies (50 to 500 employees)
- 800 customers / ARR: €12M / ACV: €15,000/year

Available Data

- CRM: deal source, sales cycle, industry, ARR
- Product usage: DAU, features used, login freq., last active
- Support: ticket volume, severity, resolution time
- NPS: quarterly survey, score by account

Management Challenges

- 1 NRR declining - currently 105%, target 115%**
Churn is eroding expansion revenue gains
- 2 Sales time wasted on future churners**
AEs closing accounts that leave within 12 months
- 3 CS team has no prioritization method**

Time: 20 minutes | Work in groups | Prepare to present

See next slide for questions

Case Study | Group Exercise - Questions

01**Use Case Identification**

Identify 3 data use cases addressing the 3 management challenges. For each: data used, analytical approach, decision enabled, expected business impact.

02**Prioritization**

Plot your 3 use cases on the value vs. feasibility matrix. Justify each positioning with specific arguments.

03**KPI Definition**

For your highest-priority use case, define 3 KPIs to track success - at least 1 technical KPI and 1 business KPI.

04**Risk Assessment**

What is the main failure risk for your top priority use case? How do you specifically mitigate it?

Business Case - Solution (1/2)

1	Churn Prediction Model Data: Product usage (login freq., feature adoption, last active) + support tickets + NPS Method: Logistic regression or gradient boosting on labeled historical churn events	Decision: CS team prioritizes accounts with >60% churn probability 60 days before renewal Impact: Increase NRR from 105% to 112%+ by catching signals early
2	Account Health Score (AHS) Data: All above + contract age + ARR + expansion history Method: Composite scoring model (rule-based or ML) producing Red/Amber/Green per account	Decision: Weekly CS workqueue ordered by health score Impact: Reduce CS time on healthy accounts by 30%, redirect to at-risk accounts
3	ICP Scoring on New Leads Data: CRM deal data (won/lost) + firmographics (industry, size, source channel) Method: Scoring model on historical win rates by ICP segment	Decision: AE prioritizes leads above threshold score (7/10) Impact: Reduce sales cycle by 15%, improve win rate on high-score leads by 10 pts

Business Case - Solution (2/2)

Prioritization matrix

Use Case	Business Value	Feasibility	Priority
Churn Prediction Model	High - direct NRR impact	Medium - requires ML model	Strategic bet
Account Health Score	High - CS efficiency	High - data exists, rule-based viable	Quick win - start now
ICP Scoring on Leads	Medium - pipeline quality	High - CRM data available	Quick win

Recommended sequencing

Month 1-2	Month 1-2	Month 3-5
Account Health Score Data exists, rule-based model, immediate CS impact	ICP Scoring CRM data available, run in parallel with AHS	Churn Prediction Model Requires ML development, label historical churn events first
